```
'Nat Nat_context { .Nat } prods "Natural" defconstr
```

```
'zero Nat_context { .zero } funs "0" defconstr
```

```
Nat 'n -> 'succ Nat_context { .succ ( n ( .Nat .zero .succ ) ) } funs "S n" defconstr !
```

The `Nat` type is defined to *Natural* . $\lambda(n : \textit{Natural}).\mu(n)$ has type $\forall(n : \textit{Natural}) (\text{Nat}^P : \textit{Natural} \rightarrow \textit{Set}_1), \text{Nat}^P 0 \rightarrow (\forall(n_0 : \textit{Natural}), \text{Nat}^P n_0 \rightarrow \text{Nat}^P (S n_0)) \rightarrow \text{Nat}^P n$.

$\lambda(n : \textit{Natural}).S n$ has type $\textit{Natural} \rightarrow \textit{Natural}$.
